### ABSTRACT

A wide range of isoxazoles and isoxazoline-5-ones properly substituted with sulphonamide moiety were prepared as possible antibacterial compounds. Their structures have been confirmed on the basis of elemental analysis, IR, NMR and mass spectral data.

### INTRODUCTION

A WIDE range of physiological properties are found to be associated with isoxazoles<sup>1-3</sup> and isoxazolines<sup>4-7</sup>. As sulphonamides have also been reported to exhibit significant antibacterial activity, it was considered interesting to synthesize some isoxazoles and isoxazoline correctly substituted with sulphonamide moiety at position four. In the present paper several such compounds have been synthesized by incorporating sulphonamide moiety at position 4, of the isoxazole or isoxazoline rings. It is expected that introduction of such a moiety will turn these compounds into competitive antagonists of *p*-aminobenzoic acid<sup>8</sup>.

### EXPERIMENTAL

Melting points of the synthesized compounds were determined using a Kofler hot stage apparatus and are uncorrected. IR spectra were obtained on an infrared spectrophotometer (Beckman IR-20) and  $\lambda_{\max}$  were determined on a UV-VIS Specord-spectrophotometer (C. Zeiss, Jena). C, H or N analysis gave satisfactory results. The mass spectra of some selected samples were scanned on a Hewlett Packard (5985B) instrument. NMR spectra were recorded on an IBM NR-80 spectrometer.

The sulphadruugs used in these studies were sulphanilamide, sulphacetamide, sulphamethoxy-pyridazine, sulphadiazine, sulphamerazine, sulphaguanidine, sulphadimidine, sulphapyridine, sulphaphenazole and sulphathiazole were obtained from Sigma Chemical Company, USA. The reactive methylene compounds, pentane-2,4-dione, 1-phenyl-1,3-butanedione, 1,3-diphenylpropane-1, 3-dione and ethyl 2,3-dioxobutyrate were BDH products. The diazotization of the appropriate sulphadruug and their coupling with reactive methylene compounds was carried out by the method reported in the literature<sup>9</sup>.

### *1,3-Diphenyl-2-(p-sulphamoylphenylhydrazone) propane-1,3-dione*

Sulphanilamide (0.0125 M) was dissolved in a mixture of concentrated hydrochloric acid (6.3 ml) and water (6.3 ml), and cooled to 0°C. Sodium nitrite was gradually added to this cooled mixture and vigorously stirred. The diazotized sulphanilamide solution thus obtained was filtered into a well-cooled solution of 1,3-diphenylpropane 1,3-dione (0.0125 M) dissolved in ethanol (25 ml) and sodium acetate (8.0 g). A precipitate began to separate almost immediately. This was allowed to stand overnight, filtered, dried and recrystallized from ethanol m.p. 130°C. [Found: C = 61.7%, H = 4.10%, N = 10.10% Calc. for C<sub>21</sub>H<sub>17</sub>N<sub>3</sub>O<sub>4</sub>S, C = 61.9, H = 4.17%, N = 10.31%].

### *Preparation of the isoxazole*

1,3-Diphenyl-2-(*p*-sulphamoylphenylhydrazone) propane-1, 3-dione was dissolved in ethyl alcohol (40 ml) on heating and to this an aqueous solution of hydroxylamine hydrochloride (0.34 g) containing sodium acetate (1 g) was added. The mixture was refluxed for 5 hr and cooled to room temperature. Shining crystals thus separated, were filtered, dried and crystallized from ethanol. It had a m.p. 178°C. [C = 62.01%, H = 3.83%, N = 13.73% Calcd. for C<sub>21</sub>H<sub>16</sub>N<sub>4</sub>O<sub>3</sub>S, C = 62.37%, H = 3.96%, N = 13.86%].

The characteristics of isoxazoles prepared by this method using different sulphadruugs and reactive methylene compounds are summarized in table 1.

Isoxazolin-5-ones were similarly prepared by using the hydrazone (0.005 M) obtained from sulphonamides and ethyl-2,3-dioxobutyrate. Their characteristics are given in table 2.

The compounds were characterized on the basis of their elemental analysis for C,H and N. The presence of characteristic absorption bands at 1600-1630 cm<sup>-1</sup> for -N = N-linkage, 1150-1170 cm<sup>-1</sup>

and 1330–1350 cm<sup>-1</sup> for cyclic –C = C– and 740–760 cm<sup>-1</sup> for substituted phenyl ring<sup>10,11</sup> further supported the proposed structure. The mass spectral studies of the selected samples (1,4,10,16 and 22) also provided evidence for molecular ion peak. The observed  $\lambda_{\max}$  in the visible region clearly indicated that  $\pi$  chromophore system has been extended. The NMR spectra of compound 10 (table 1) exhibited  $\delta$  value: 2.814 (d,6H,2CH<sub>3</sub>), 6.51 (t,1H,NH<sub>2</sub>), 7.81 (m,4H,ArH) and 8.611 (d,3H, protons on the pyrimidine ring). Some of the selected samples have been sent for evaluation of their antibacterial and antineoplastic activity and the results will be reported later.

#### ACKNOWLEDGEMENTS

The authors thank the Director, IIP, Dehradun for permission to carry out the elemental analysis and to Mr. S. K. Tyagi, University of Oklahoma, Norman, USA for the NMR and mass spectral data. One of the authors (AM) is grateful to CSIR, New Delhi for a fellowship.

## NEWS

### NOBEL PRIZE IN MEDICINE

Dr. Susumu Tonegawa, a Japanese Professor at the US Massachusetts Institute of Technology (MIT) is the winner of the 1987 Nobel Prize for Physiology and Medicine for his discovery of “the

genetic principle for generation of antibody diversity”. Dr. Tonegawa is the seventh Japanese Nobel Prize winner, but the first for Physiology and Medicine.
